Process Mining

SAP

Faster process analyses: Create event logs in an instant and stay up to date with automated updates of process data.

Business Challenge

More efficient processes, cost reductions, higher transparency - these are the most important goals of Process Mining. The process analysis itself is done quickly. According to a Gartner market study, 80% of the effort goes into finding and preparing the relevant data. Companies combine different tools for data extraction, data preparation and process evaluation.

- 01 The combination of different tools causes high costs.
- 02 It takes a lot of time and manual effort to create event logs for process analyses.
- 03 Users need technical know-how to apply the tools.

The solution

With dab:neXus, companies can use one central analysis platform through which auditors and business users can generate and fully automate event logs for Process Mining with just a few clicks.

Numerous predefined data sets for SAP standard processes shorten the way to visualise and analyse processes.

Thanks to the scheduling function, event logs can be generated automatically, and regular analyses can be carried out cost-efficiently.

As an on-premises application, the data is securely stored in your own network.

dab:neXus is conveniently usable from a browser within your network and thus does not require a local client installation.

Predefined process analyses

Data preparation is predefined for numerous SAP standard processes, event logs are generated in minutes.

End-to-End-Solution

dab:neXus combines data extraction and event log generation in one application.

Scheduling

Regular analyses can be automated, with dab:neXus making delta extractions possible.

Usability

The platform is intuitively designed and enables smooth cross-divisional collaboration.

Data protection

Personal data is pseudonymised in the standard, and data protection is complied with according to German and EU law.

A new generation of data preparation in Process Mining: dab:neXus optimises and automates data provision from SAP so that companies have more time for the analysis and improvement of their processes.

User management

Access rights and the range of functions of the platform can be controlled via role assignments.

Transparency

Customers can monitor the extraction and analysis progress in the application.

CHANGING DATA INTO KNOWLEDGE
